

CSCE 771: Computer Processing of Natural Language Lecture 24: Conversation Agents

PROF. BIPLAV SRIVASTAVA, AI INSTITUTE 14TH NOVEMBER, 2024

Carolinian Creed: "I will practice personal and academic integrity."

Organization of Lecture 24

- Opening Segment
 - Recap of Lecture 23

Main Lecture

- Concluding Segment
 - About Next Lecture Lecture 25

Main Section

- Conversation Agents
 - Rule based methods
 - (Deep) learning based methods
- Applications
- Ethical Issues

Recap of Lecture 23

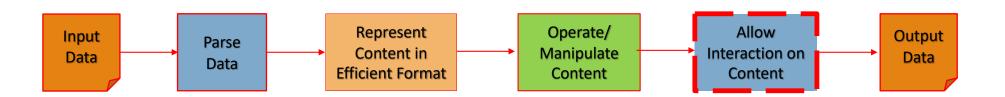

- Summary generation
- Methods
 - Extractive traceable to original content
 - Abstractive non traceable to original content
 - Compressive remove content but not information
- Applications

Main Lecture

NLP Task - Stateful Interaction

The system itself can do any task:

- Question / answering
- Information retrieval
- Chitchat
- ...

Chatbots - Background

- Conversation agents and interfaces (chatbots) are getting easy to build and deploy
 - · Can be text-based or speech-based
 - Usually multi-modal (i.e, involving text, speech, vision, document, maps)
- Current chatbots typically interact with a single user at a time and conduct
 - Informal conversation, or
 - Task-oriented activities like answer a user's questions or provide recommendations

Demonstrations

- *Eliza*, http://www.manifestation.com/neurotoys/eliza.php3
- Mitsuku, https://www.pandorabots.com/mitsuku/

Current State

- Handle uncertainties related to
 - Natural language
 - Human behavior
- Dialog Management
 - Reasoning on data's abstract representations (Inouye 2004)
 - Learning policies over predictable nature of data (Young et al. 2013)
 - Statistical machine learning for dialog management: its history (Crook 2018)

- Hype around potential
- User feedback is mixed
 - Novelty value for chit-chat but concerns about usability (e.g., Tay)
 - Deployed for customer support commonly but usage is often low (compared to other channels), capability is limited (usually single turn), and not considered the preferred channel of choice for most users

Chatbots in Dynamic Environment

- Data changes, e.g. sensor data
- Groups of people, who come and go in environment
- Multi-modal interfaces, i.e., modes beyond conversation, like map, graphics and documents
- Dialog Management
 - · Combination of learning and reasoning

S.No.	Dimension	Variety
1	User	1, multiple
2	Modality	only conversation, only speech,
		multi-modal (with point, map,)
3	Data source	none, static, dynamic
4	Personalized	no, yes
5	Form	virtual agent, physical device, robot
6	Purpose	socialize, goal: information seeker,
		goal: action delegate
7	Domains	general, health, water, traffic,

Current Practice of Water Advice

Advisories to public for Flint Residents, MI, USA

Physical signage at a lake in Washington, USA

Decision-Support in Water: Problem and Objective

Guide every day people, who may be non-experts, with a multi-modal assistant to take data-based decisions specific to their needs, leveraging complex water quality data.

Audience

- General Public that wants to understand water quality at a specific location (e.g., swimming)
- Professionals with responsibility for regions (e.g., public health)

Before and After

Now: Static, non-interactive, non-contextual, lacks data details

Future: Anywhere, interactive, explain with data, contextual

Demo: Water Advisor

https://www.youtube.com/watch?v=z4x44sxC3zA

Jason Ellis, Biplav Srivastava, Rachel K. E. Bellamy, Andy Aaron, <u>Water Advisor – A Data-Driven, Multi-Modal, Contextual Assistant to Help with Water Usage Decisions</u>, at Proc. 32nd AAAI Conference on Artificial Intelligence (AAAI-18), New Orleans, Lousiana, USA, Feb 2-7, 2018. [Demonstration, Water].

Al Technical Issues in Collaborative Assistants for Water

Dimensions	General	Water Specific
Learning	Off-the-shelf trained intents	Water quality trends
Representation	Representation of raw data	Activity purpose and related parameters, water safety limits
Reasoning	Rule-based handling of missing values	Location and activity based regulation selection, interpreting safe limits for a parameter
Execution	Controlling interaction modules, asking questioning and parsing responses	Generating error rates, system confidence and usability rules
Human Usability Factors	Using error rates of conversation modules to control questioning strategy	Using missing data to control water advice in generated natural output.
Ethical Issues	Biases, adversarial examples, privacy violations, safety challenges and reproducibility concerns	Preference encoded in rules based on activities: recreation over drinking

Potential of Conversation Agents in Helping People

Characteristics and Potential

Chatbots

- Support a natural mode of interaction
- Create a visible presence for an organization providing AI technology to users
- Provide a sequential, slow mode of interaction (compared to the parallel, visual mode)

Areas where people want help

- Retrieve information
 - · Contextual, user-specific, data access
 - Making data accessible to people with disability
- Decision making: Helping choose among complex alternatives
- · Collaboration and mediation: among people making complex decisions

Everyday Scenarios - People

- •Travel: "Which train can I take to office?"
 - Needs information about locations, train schedules and status, personal schedule
 - Category: information seeking
- •Health: "Who can I see now for my pain in the stomach?"
 - Needs information about location, likely medical situation, medical specialties, doctors and health care providers in the vicinity, insurance and payment situation, availability of services
 - Category: information seeking, choosing among alternatives
- •Social: "How do I meet my visiting friend with family at an evening?"
 - Needs information about schedule of friend's family and mine, location of home and friend's stay, capacity of home and restaurants in the area
 - Category: information seeking, choosing among alternatives, collaboration

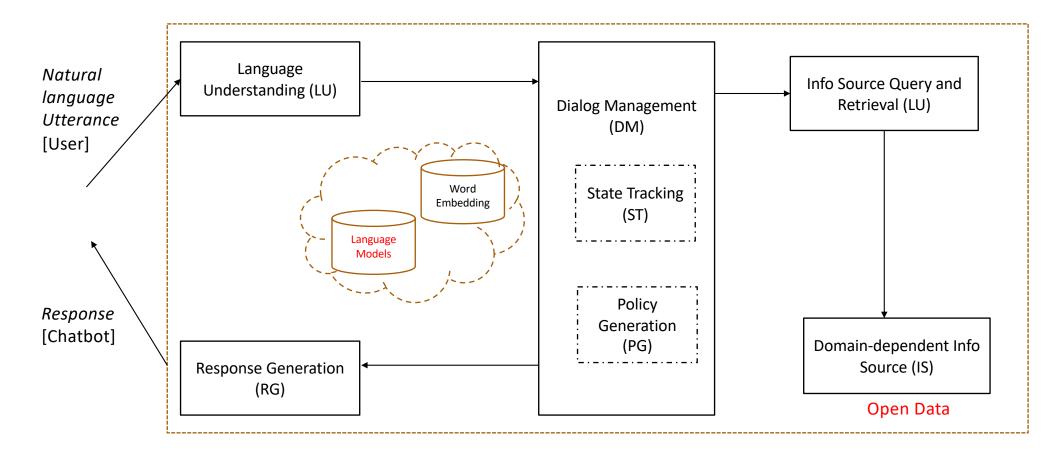

Everyday Scenarios - Business

Guidance

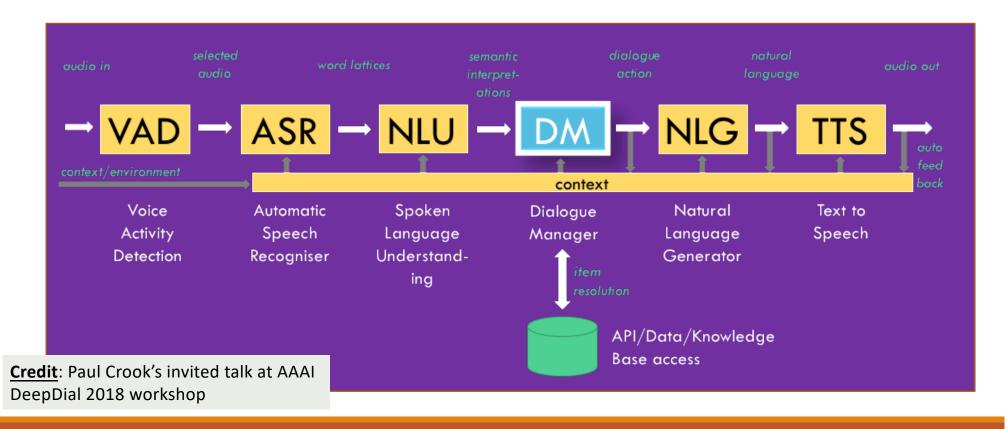

- During data science
 - Rogers Jeffrey Leo John, Navneet Potti, Jignesh M. Patel, Ava: From Data to Insights Through Conversations. CIDR 2017
- Skilling and professional development
- Collaboration and Mediation Decisions
 - Hiring a candidate
 - · Scheduling an activity, e.g., medical operation
 - Merger and Acquisitions

Building a Chatbot

General Architecture - Chatbot

Modular Building Approach – Speech Augmented

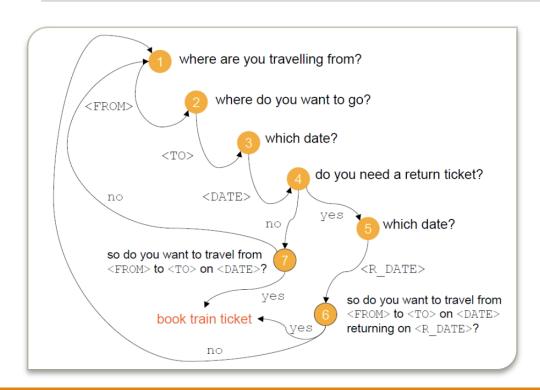

Open Source Tools

```
    Rasa – <a href="https://rasa.com/">https://rasa.com/</a> // Primarily rules
    Open source LLM-based – e.g., Llama // Deep-learning based
    ParlAI - <a href="https://parl.ai/">https://parl.ai/</a> // Flexible: Deep-learning / RL / rule-based
    MindMeld - <a href="https://www.mindmeld.com/">https://www.mindmeld.com/</a> // Primarily rules
```

Type of Methods for Policy Generation

- Finite-state
- Frame-based
- Response-generation (including learning)
- Inference based (including planning)

Finite State DM / PG

- Nodes both represent dialogue states and have associated output prompts by the system.
- Arcs represent expected user input.
 They lead to state transition.

Finite State DM / PG

- The policy is a program at each node that the system executes if triggering conditions are met
- The set of possible paths in the flow diagram define the set of legal dialogues.
- •The system has control over the conversation at all times.
- The user is assumed to be cooperative
 - · Unexpected responses or extra information is usually ignored
 - System focused on the immediate / last user prompt.

where are you travelling from?

where do you want to go?

which date?

do you need a return ticket?

yes

which date?

so do you want to travel from

FROM> to <TO> on <DATE>

yes

book train ticket

yes

so do you want to travel from

FROM> to <TO> on <DATE>

returning on <R_DATE>?

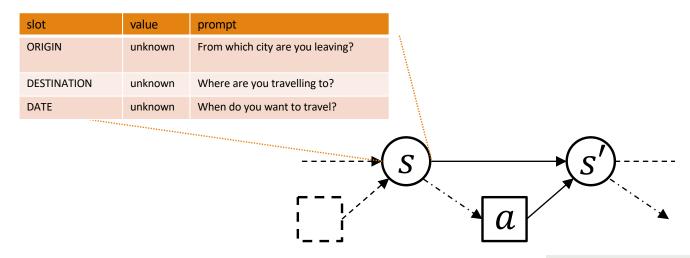

Frame-Based DM/PG

- A declarative, data-driven approach
- Frames consist of slots (variables), values and (system) prompts
 - Can be extended to capture ASR/NLU confidence scores, and grounding between the user and the agent
- A control algorithm determines what to say next based on the frame contents.
- The control specification can be as simple as collect the first slot that has an unknown value.
- Slots can be filled/refilled in any order and user responses can fill more than one slot.
 - Assumes an ASR and NLU models capable of interpreting multi-slot and out-of-expected-turn utterances.

slot	value	prompt
ORIGIN	unknown	From which city are you leaving?
DESTINATION	unknown	Where are you travelling to?
DATE	unknown	When do you want to travel?

Frame-Based DM/PG

Assuming the frame contains all the information required for the control algorithm to act optimally, the control task maps onto a Markov Decision Process (MDP).

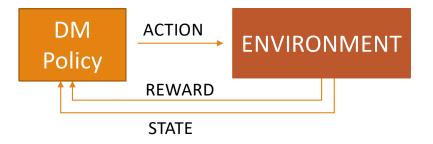

A MDP is defined as a tuple (S, A, T, R). Established approaches exist for learning optimal policies.

Reinforcement Learning for DM

Given a MDP, techniques such as Reinforcement Learning (RL) can be applied to optimize the policy through trial and error.

RL framework:

Needs:

- Dialog data for training
- Variation: Partially observable MDP

<u>Credit</u>: Adapted from Paul Crook's invited talk at AAAI DeepDial 2018 workshop

Comparing Approaches

Finite-State DM

Procedural

Advantages:

- Easy to understand; many designers and developers familiar with procedural approaches
- Precise control of dialogue paths allows:
 - easy constraint of the dialogue when required (e.g. account payment processing)
 - risk adverse designs/simplified ASR & NLU
 - easier scripting of intelligent sounding prompts; e.g. accounting for pragmatics

Disadvantages:

- Ridged dialogues can frustrate users
- Flow-diagrams quickly become complex

Frame-Based/IS DM

Typically Declarative

Advantages:

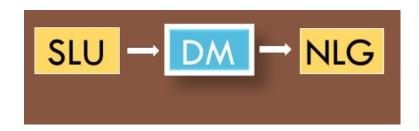

- Easy to author slot filling dialogs
- Allows for flexible, user directed and mixed initiative dialogues

Disadvantages:

- Scripting good system prompts is more challenging – need sophisticated NLG to avoid sounding robotic or repetitious (and to encode pragmatics)
- Imposing constraints on the dialogue paths can be complicated, e.g. developers less comfortable with declarative programming

Response Generation DM/PG

 Response-Generation approaches collapse the user understanding to generation process by learning a direct input to output function

- They are appealing in that they
 - eliminate the manual design of internal ML features (especially Seq-2-Seq models),
 - are end-to-end trainable from unannotated NL "query-response" pairs,
 - have been shown to generate surprising engaging dialogues,
 - can capture human conversational norms like politeness, etc.

Response Generation Methods

- Information Retrieval / ranking query-response pairs.
 - [Filter, rank, and transfer the knowledge: Learning to chat. S. Jafarpour et al., NIPS, 2009]
 - [NPCEditor: Creating virtual human dialogue using information retrieval techniques. A. Leuski and D. Traum,
 AI Magazine 2011]
- Phrase-based Machine Translation.
 - [Data-driven response generation in social media. A. Ritter et al., EMNLP, 2011]
- Seq-2-Seq models.
 - [Neural responding machine for short-text conversation.
 L. Shang et al., ACL, 2015]
 - [A neural conversational model. O. Vinyals and Q. Le, ICML Deep Learning Workshop, 2015]
 - [A neural network approach to context-sensitive generation of conversational responses. A. Sordoni et al., NAACL HLT, 2015]

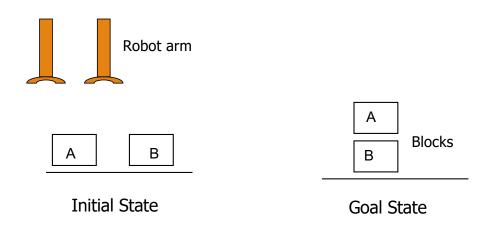

Inference-Based DM/PG

- Inference-Based DM considers dialogue as a planning task.
- •The DM has a set of goals and axioms and is equipped with plan-based reasoner, e.g. a theorem prover.
- Dialogue acts are instances of goal-orientated *action schema*; typically specified in terms of constrains, preconditions, goals and effects, e.g.

```
 \begin{array}{l} \textbf{BOOK}(S,U,T) \\ \textbf{Constraints: } System(S) \wedge User(U) \wedge Ticket(T) \\ \textbf{Goal: } Booked(S,U,T) \\ \textbf{Preconditions: } Knows(S,Origin(T)) \wedge Knows(S,Dest(T)) \wedge ... \\ \textbf{Effects: } Booked(S,U,T) \\ \textbf{INFO\_REQUEST}(A,B,P) \\ \textbf{Constraints: } Speaker(A) \wedge Addressee(B) \wedge Prop(P) \\ \textbf{Goal: } Know(A,P) \\ \textbf{Preconditions: } \neg Know(A,P) \wedge Desire(A,Know(A,P) \wedge Believe(A,Know(B,P)) \wedge ... \\ \textbf{Effects: } Believe(B,Desires(A,Know(A,P))) \end{array}
```

is train 12312 on time today?

TDEBot, 3:29 PM

Train Number 12312 will be delayed by 278.0 minutes at HWH station on 2018-10-18

3:29 PM

Where is the bottleneck?

- Leak information
- Abusive language
- Complex response

TDEBot, 3:29 PM

The bottleneck station is FTP causing delay of 90.2 minutes on 2018-10-18

3:32 PM

What is FTP?

TDEBot, 3:32 PM

Sorry, I didn't understand! Please Try again

3:32 PM

What is the delay at Allahabad?

TDEBot, 3:33 PM

Train 12312 will not be mitigated any more after station ALD on 2018-10-18. It will arrive even later by 52.0 minutes
